

TREATING APPARATUS FOR ORGANIC WASTE

ABSTRACT OF THE DISCLOSURE

The treating apparatus for organic waste mainly is provided in a machine with a receiving room and a water cleaning room, 5 the receiving room has a screening device; the screening device is driven by a driving device, and is provided therein with compound bacteria that can fast bacterialize and decompose organic material. When waste enters the screening device, the organic material can be decomposed and turned into water by using 10 fermentation and decomposing of the compound bacteria, and then the water flows into the water cleaning room to deodorize and sterilize, the inorganic material unable to be decomposed is separated by the screening device, and thereby an object of concentrated treating is achieved.
